DURABLE SOLUTIONS PROGRESS (DSP) SURVEY (2025)

PHASE 2: KEY FINDINGS SUMMARY
HIRSHABELLE, GALMUDUG AND PUNTLAND
STATES

The summarized report presents the key findings identified in the second phase of the Durable Solutions Progress (DSP) Survey. This serves as complimentary overview of results from the second phase of the survey, and thus is not exhaustive of all findings. All information products, including a full analysis report, city-level factsheets, and an interactive dashboard can be accessed by scanning the below QR code, and are available [ON THIS LINK](#).

INTRODUCTION

The Durable Solutions Progress (DSP) Survey is a government-led initiative spearheaded by the the National Center for Rural Development an Durable Solutions (NCRDS), which is part of the Ministry of Interior, Federal Affairs and Reconciliation (MoIFAR), and the Somali National Bureau of Statistics (SNBS).

Under the leadership of authorities, the survey is supported by the International Organization for Migration (IOM) and the Danwadaag Durable Solutions Consortium, with co-funding from the Internal Displacement Solutions Fund (IDSF) and the Saameynta Joint Programme.

The survey is strategically aligned with the National Solutions Pathways Action Plan (2024-2029), the National Transformation Plan (2025-2029), and the National Strategy for the Development of Statistics 2. Survey data informs nationally owned solutions to displacement as part of system-wide development frameworks.

The survey's implementation has been structured into two distinct phases to ensure comprehensive national coverage. Phase one, conducted between April and June 2024, established a baseline by covering 60% of the national IDP caseload across nine cities. Phase two, which took place from September to November 2025, expanded this reach to approximately 75% of the caseload. This second phase focused on nine key urban centers with significant displaced populations, including Bossaso, Beledweyne, Caabudwaaq, Cadaado, Dhusamareeb, Garowe, Jowhar, and Galkayo Galkayo (North and South).

DURABLE SOLUTIONS PROGRESS (DSP) SURVEY - COVERAGE MAP

METHODOLOGY AND ANALYTICAL FRAMEWORK

The Durable Solutions Progress Survey (DSP) Phase 2 is a household-level assessment designed to measure progress towards durable solutions among internally displaced persons (IDPs) and host community (HC) households in urban centers in Somalia. Phase two was implemented across nine urban centers in Somalia: Bossaso, Beledweyne, Caabudwaaq, Cadaado, Dhusamareeb, Garowe, Jowhar, and Galkayo (North and South). Using structured interviews, the study measured progress towards durable solutions by evaluating households against minimum thresholds for key indicators.

The DSP tool is comprised of indicators in line with the National Solutions Pathways Action Plan, and is aligned with the National Transformation Plan, and the National Strategy for the Development of Statistics 2. Indicator modules also reflect the IASC Durable Solutions Criteria and the International Recommendations on IDP Statistics (IRIS) framework has been adapted to the local context.

Furthermore, the DSP data analysis focused on binary outcomes aggregated by city and population group, across the key IASC Durable Solutions Criteria and supplemented by a composite DSP Index to summarize overall progress. To ensure accuracy, all data underwent rigorous automated and manual validation, including field revisits and logical consistency checks. While subject to self-reporting biases, this survey provides the most comprehensive government-led empirical basis for assessing urban displacement outcomes in Somalia.

IASC FRAMEWORK ON DURABLE SOLUTIONS FOR INTERNALLY DISPLACED PERSONS

ANALYTICAL APPROACH

PROGRESS TOWARDS DURABLE SOLUTIONS

OVERVIEW OF KEY FINDINGS

HOUSEHOLD CHARACTERISTICS

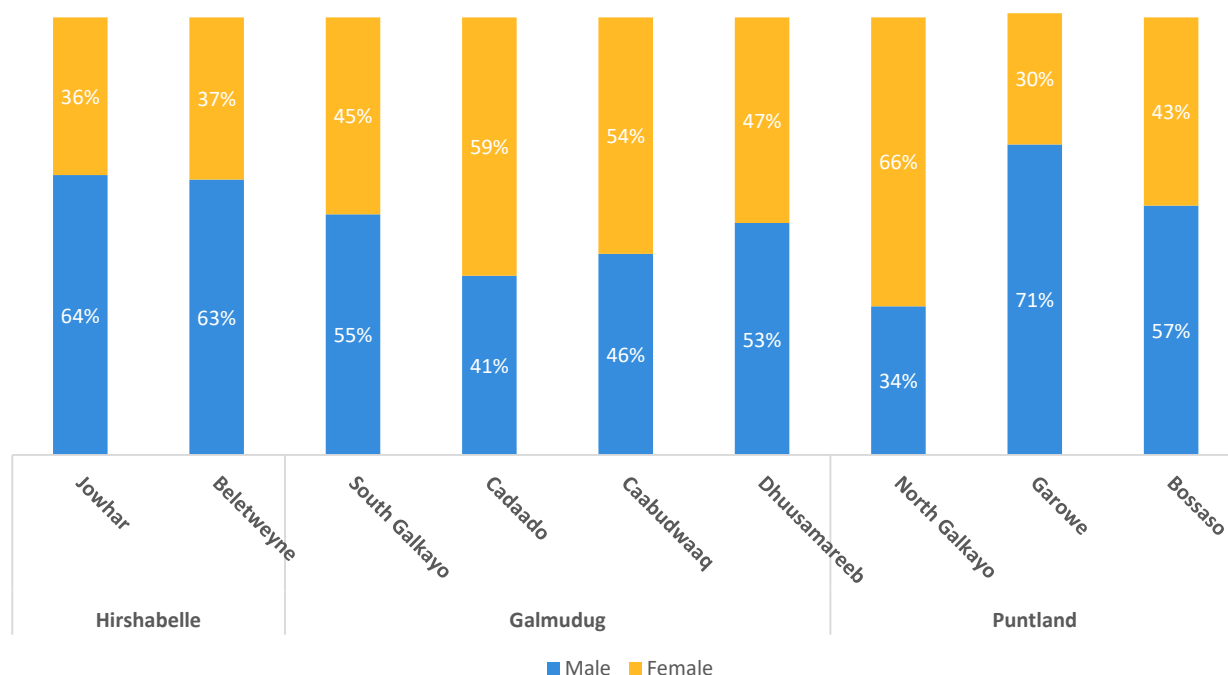

HOUSEHOLD SIZE

Average household size across cities ranges from 4 to 6 members. Beletweyne has the smallest households size (4), while Caabudwaaq, Garowe, and Jowhar report the largest (6). Most other cities cluster around 5 members, indicating broadly similar household structures across urban areas.

SEX OF HOUSEHOLD HEAD

Female-headed households are more prevalent in North Galkayo (66%), Cadaado (59%), and Caabudwaaq (54%), while male-headed households are more common in Garowe (71%), Jowhar (64%), Beletweyne (63%), and Bossaso (57%). Dhuusamareeb and South Galkayo show a more balanced pattern, highlighting strong city-level variation in household leadership.

Figure 1: Head of household sex

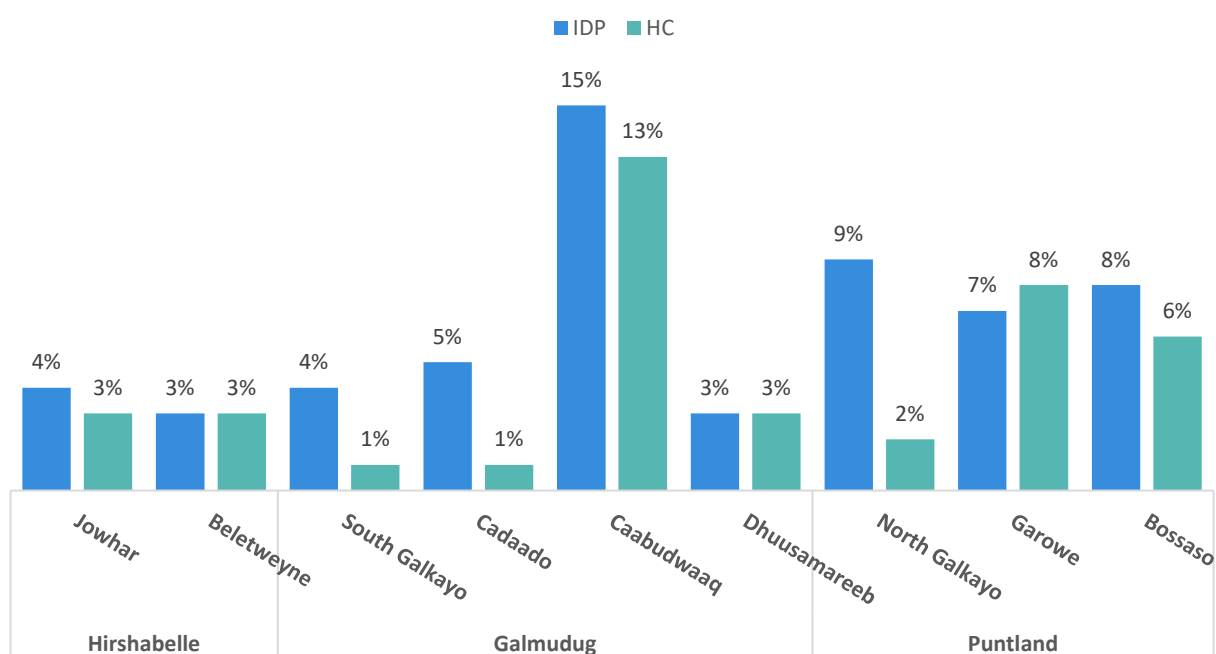

HOUSEHOLD DISABILITY

Disability prevalence varies across cities and is generally higher among IDP households than host communities, highlighting displacement-related vulnerability. The largest gaps are observed in North Galkayo (9% IDPs vs. 2% host), Caabudwaaq (15% vs. 13%), Cadaado (5% vs. 1%), and South Galkayo (4% vs. 1%). These patterns suggest that displacement is often associated with higher exposure to risks that increase the likelihood of disability at the household level.

In contrast, some cities show similar levels between the two groups, such as Beletweyne and Dhuusamareeb (both 3%), while Garowe records a slightly higher prevalence among host communities (8%) than IDPs (7%). Overall, the results point to the need for city-specific and displacement-sensitive disability responses, recognizing that while IDPs are often more affected, disability is a shared concern across urban populations in Somalia.

Figure 2: Percentage of households with at least one disability

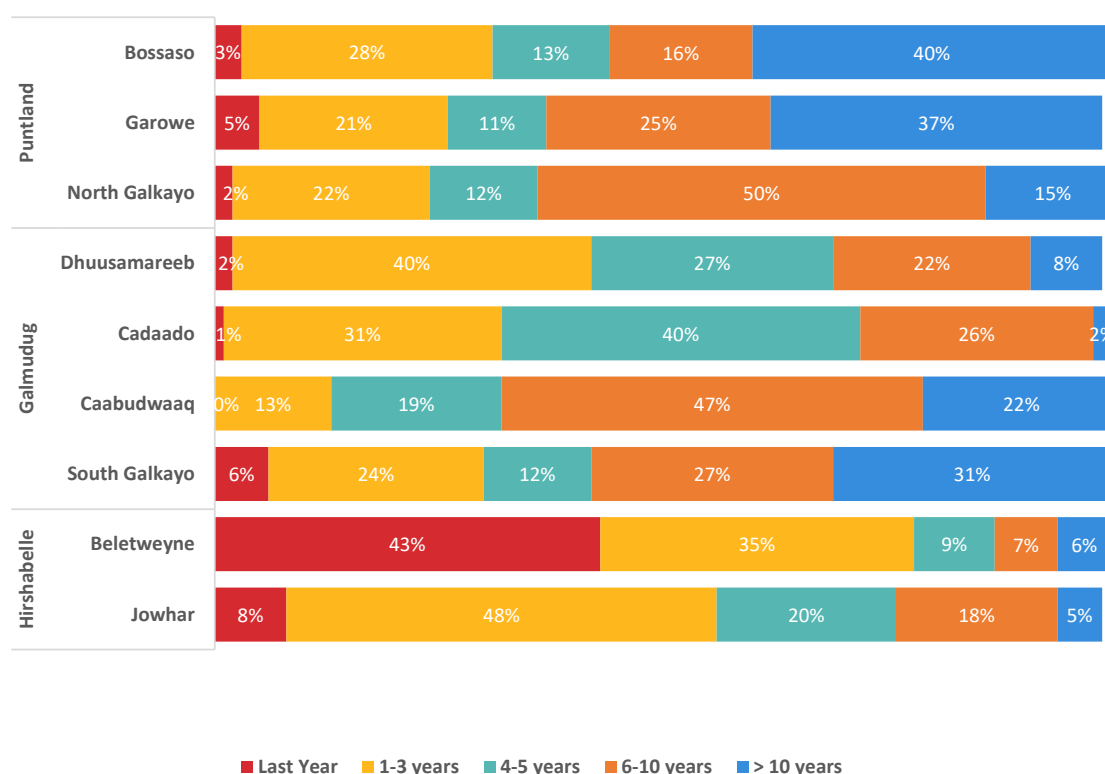

LENGTH OF DISPLACEMENT

The displacement duration varies among cities and is predominantly protracted. Nearly half of IDPs (46%) have been displaced for more than five years, compared to 29% displaced for 1–3 years and only 8% displaced in the last year, indicating that displacement in the northern states of Somalia is largely long-term rather than recent.

City-level patterns vary. Caabudwaaq and North Galkayo show very high long-term displacement (6–10 years), while Bossaso and South Galkayo have substantial shares displaced for over 10 years. Beletweyne, in contrast, is characterized by more recent displacement, largely within the last year. These differences call for city-specific durable solutions, combining short-term stabilization with long-term integration and tenure support.

Figure 3: Length of displacement by city

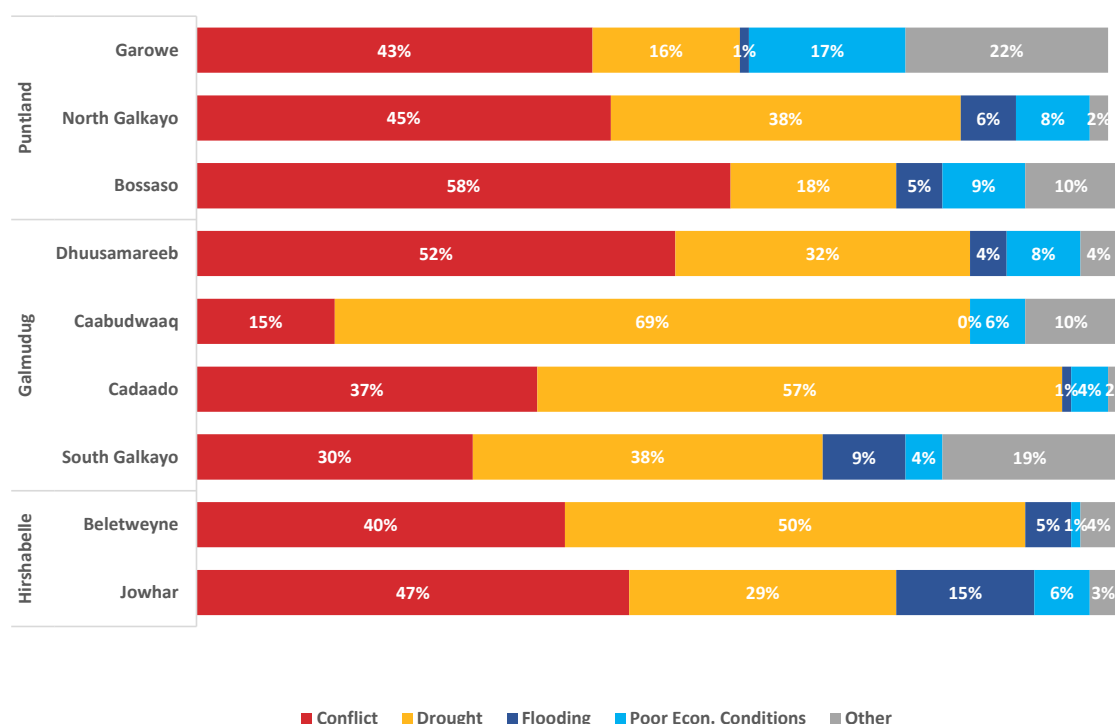

REASONS OF DISPLACEMENT

Conflict and drought are the primary drivers of displacement, together accounting for around 80 percent of reported reasons overall. Drought is the leading cause in several central locations, particularly Caabudwaaq, Cadaado, and Beletweyne, reflecting prolonged rainfall deficits and declining livelihood conditions. In contrast, conflict-driven displacement is more prominent in urban and strategic centers such as Bossaso, Dhuusamareeb, and Jowhar, where insecurity continues to disrupt safety and access to services.

Other factors play a more localized role. Flood-related displacement is mainly reported in Jowhar and South Galkayo, while poor economic conditions are more evident in Garowe and North Galkayo, pointing to market and income-related pressures. Overall, the findings confirm that displacement is driven by a combination of security, climatic, and economic shocks, with clear geographic variation in dominant drivers.

Figure 4: Reasons of displacement

THE FEDERAL GOVERNMENT OF SOMALIA'S SOLUTIONS MEASUREMENT: THE DURABLE SOLUTIONS PROGRESS (DSP) SURVEY INDEX

The DSP Index results for the 8 cities indicate a consistent pattern in which host communities (HC) achieve higher index scores than internally displaced persons (IDPs) across all assessed locations. In most cities presented, host community scores fall within the “high” progress category (scores between 4 and 5), while IDP scores fall within the “medium” progress category (scores between 2 and 3).

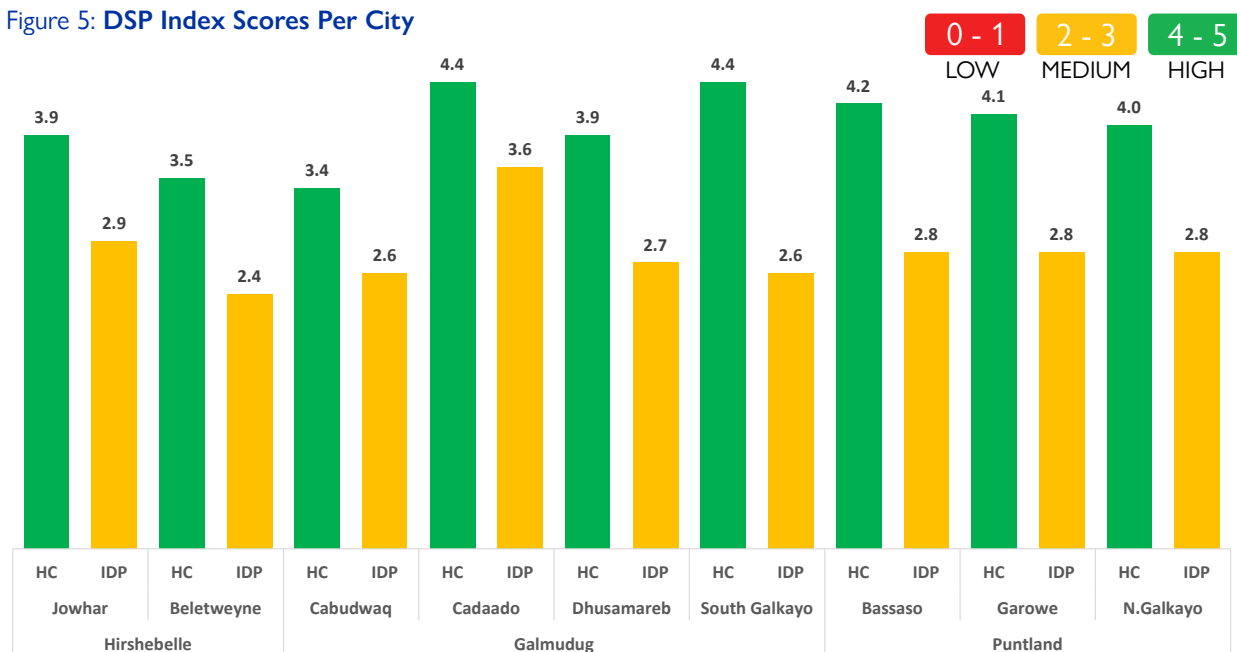

In Bossaso, host communities record an index score of 4.2, compared to 2.8 among IDPs. A similar pattern is observed in Garowe, where host communities score 4.1 and IDPs score 2.8. In North Galkayo, host communities achieve a score of 4.0, while IDPs again score 2.8, maintaining the same level of medium progress observed among IDPs in Puntland cities.

In Cabudwaq, host communities score 3.4, while IDPs score 2.6, placing both groups within the medium category, but with host communities clearly outperforming IDPs. In Cadaado, host communities record one of the highest scores in the chart at 4.4, compared to 3.6 among IDPs, indicating high progress for host communities and upper-medium progress for IDPs. In Dhusamareeb, host communities score 3.9, while IDPs score 2.7, continuing the consistent HC–IDP gap observed across cities.

In South Galkayo, host communities achieve a score of 4.4, while IDPs score 2.6, reflecting a wide disparity between high and medium progress levels. In Jowhar, host communities score 3.9, compared to 2.9 among IDPs, placing both groups within the medium category but with host communities closer to the upper threshold. In Beledweyne, host communities score 3.5, while IDPs record the lowest score in the chart at 2.4, though still within the medium progress range.

Overall, the DSP Index results show that all host communities are achieving high progress towards durable solutions, while all IDP populations are achieving medium progress, with no city falling into the low category. The consistent gap between host communities and IDPs across all cities highlights persistent within-city inequalities in the conditions required to achieve durable solutions, despite both groups residing in the same urban contexts.

Figure 5: DSP Index Scores Per City

IASC 1: SAFETY AND SECURITY

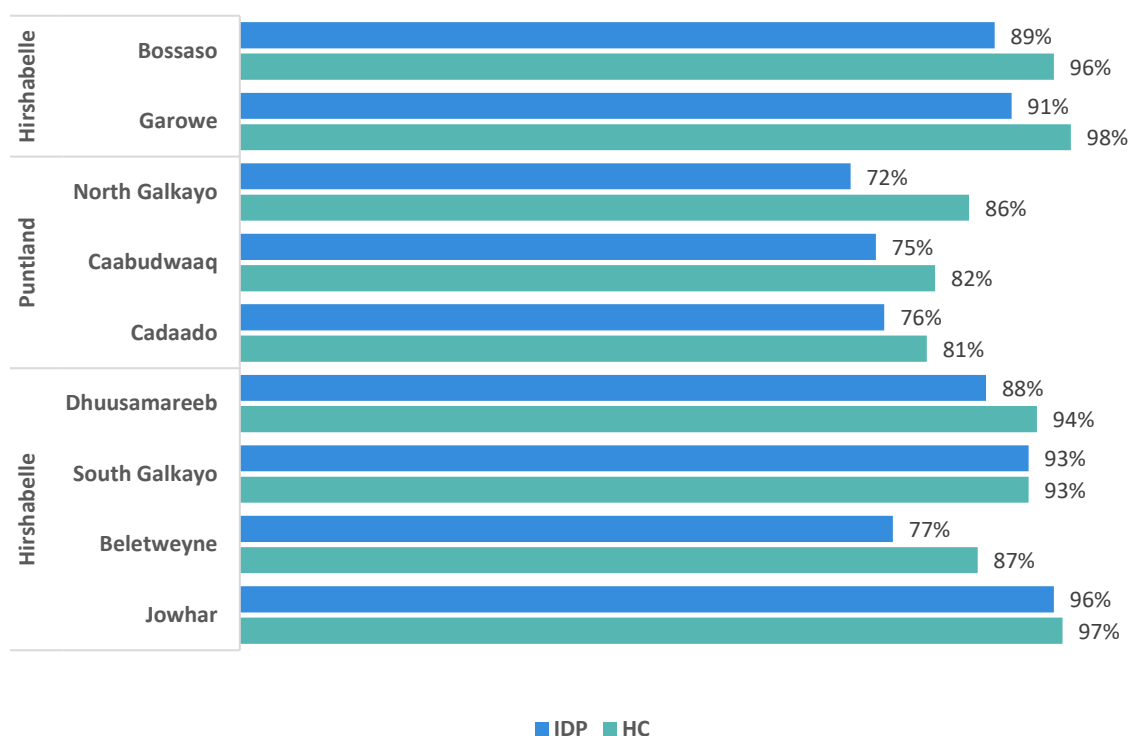

Overall safety and security outcomes indicate a relatively stable urban security environment for both host communities and internally displaced people. High proportions of households report no direct exposure to violence, with 83% of host communities and 80% of IDPs achieving positive outcomes. In several cities, including Caabudwaaq and South Galkayo, outcomes are closely aligned across groups, while lower results in Beledweyne (63% HC; 58% IDP) and North Galkayo (75% HC; 70% IDP) point to localized insecurity affecting both populations. Overall, differences between host communities and IDPs remain limited for this indicator, suggesting that violence itself is not the dominant driver of vulnerability in most assessed urban contexts.

In contrast, perceptions of safety reveal more pronounced and consistent disparities. While 72% of host community households report feeling safe, this share drops to 62% among IDPs, reflecting heightened insecurity linked to displacement status rather than direct exposure to violence. The gap is particularly evident in cities such as Bossaso (83% HC vs 63% IDP) and Garowe (89% HC vs 72% IDP), where host communities express high confidence in safety while IDPs remain significantly less secure. Even in relatively stable cities such as Jowhar, IDPs continue to lag behind host communities (82% vs 87%), underscoring that tenure insecurity, social exclusion, and limited protection mechanisms shape IDPs' lived experience of safety.

Beyond immediate security concerns, structural vulnerabilities further constrain safety and stability. Disaster risk reduction outcomes remain low across all groups, with only 37% of host communities and 32% of IDPs reporting adequate preparedness, reflecting widespread exposure to climate and environmental shocks. At the same time, reliance on external assistance is high, particularly among IDPs (46%, compared to 55% among host communities), with extreme dependence observed in cities such as Cadaado (81% HC; 62% IDP) and Garowe (73% HC; 70% IDP).

Taken together, these findings indicate that while physical security conditions are largely in place, durable solutions remain constrained by perceived insecurity, environmental risk, and continued aid dependency, rather than active conflict alone.

Figure 6: Safety and Security (IASC 1) Outcomes for IDPs and Host Communities

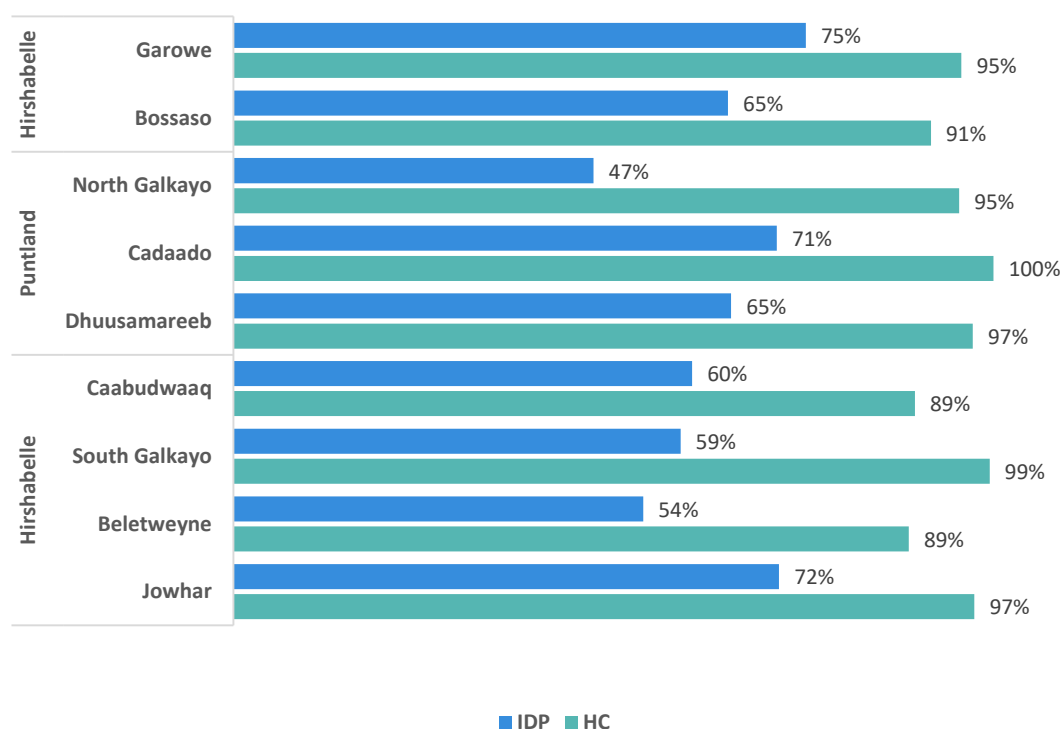

IASC 2: ADEQUATE STANDARD OF LIVING

Regarding the Adequate Standard of Living domain, substantial and persistent disparities are observed between host communities and internally displaced persons across all IASC Criteria 2 indicators. Safe access to food is reported by 83% of host communities compared to 48% of IDPs, with particularly wide gaps in North Galkayo (85% vs 30%) and Garowe (93% vs 47%), while overall food security outcomes are markedly lower, with only 23% of IDPs food secure compared to 61% of hosts and no city exceeding 35% among IDPs.

Access to healthcare also remains unequal, with 65% of host communities able to obtain needed care versus 45% of IDPs, and acute gaps in Garowe (67% vs 25%) and Dhusamareeb (64% vs 34%). Although access to safe drinking water is relatively high overall (91% HC; 68% IDP), significant disparities persist in North Galkayo (90% vs 47%) and South Galkayo (96% vs 43%), reflecting unequal access rather than infrastructure availability. Access to electricity is similarly widespread among host communities (95%) but remains substantially lower among IDPs (65%), dropping to 43% in Cadaado, undermining livelihoods and service access. Collectively, these patterns confirm that displacement status remains a primary determinant of living standards, with food security and service access barriers constituting the most binding constraints to durable solutions.

Figure 7: Adequate Standard of Living (IASC 2) Outcomes for IDPs and Host Communities

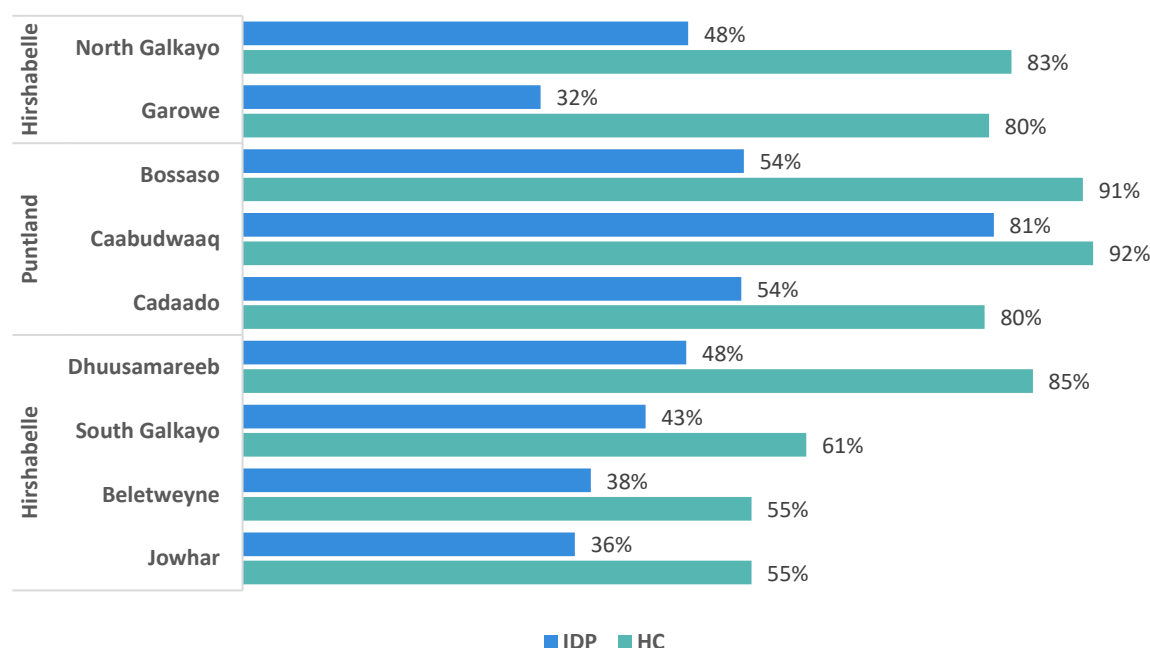

IASC 3: ACCESS TO LIVELIHOODS

Under Access to Livelihoods, outcomes remain consistently low for internally displaced people, underscoring displacement as a central barrier to economic integration and self-reliance. Only 22% of IDPs report positive outcomes in employment and livelihoods compared to 51% of host communities, with particularly stark gaps in Garowe (61% HC vs 14% IDP) and North Galkayo (66% HC vs 18%), while no city exceeds 30% among IDPs.

High reliance on assistance persists for both groups (55% HC; 46% IDP), reflecting constrained income opportunities and weak coping capacity, with near-universal dependence in cities such as Caabudwaaq (59% for both groups) and Garowe (73% HC; 70% IDP). Financial vulnerability remains pronounced, as only 17% of IDPs report holding any debt compared to 28% of hosts, indicating limited access to credit markets, while formal financial inclusion is extremely low (14% IDP vs 32% HC) and virtually absent in some cities (e.g. 0% IDP in Garowe).

These constraints translate into weaker overall economic security, where 38% of IDPs achieve positive outcomes compared to 61% of host communities, confirming that restricted access to livelihoods, finance, and markets remains a major constraint to durable solutions.

Figure 8: **Access to Livelihoods (IASC 3) Outcomes for IDPs and Host Communities**

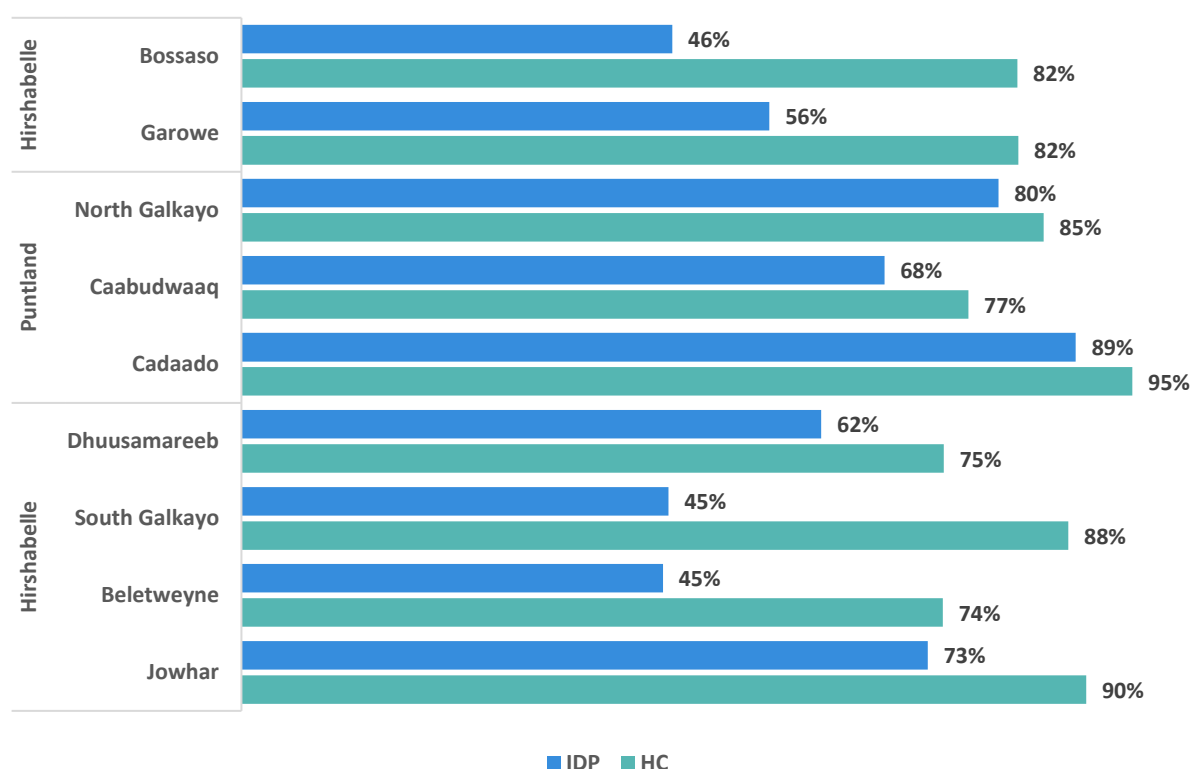

IASC 4: HOUSING, LAND AND PROPERTY

In the domain of Housing, Land and Property, displacement related disparities are most acute in formal land tenure and documentation, while outcomes related to eviction and disputes appear comparatively stronger but remain fragile for IDPs. Only 25% of IDPs report possessing documentation for the land they occupy, compared to 64% of host communities, with extremely low IDP outcomes in South Galkayo (8%), Bossaso (14%), and Cadaado (15%), underscoring widespread tenure insecurity among displaced households.

In contrast, reported protection from eviction is relatively high (85% IDP vs 90% HC), and perceived risk of eviction remains lower (73% IDP vs 83% HC), though notable gaps persist in cities such as Bossaso (63% IDP) and Garowe (61% IDP). Disputes over access to land show smaller differences (79% IDP vs 83% HC), suggesting that conflict over land is less prevalent than informal and undocumented tenure arrangements. When combined, the composite HLP indicator shows 63% of IDPs achieving positive outcomes compared to 83% of host communities, confirming that lack of legal tenure and documentation rather than immediate eviction threat remains the principal HLP constraint to durable solutions for displaced populations.

Figure 9: Housing and Land Properties (IASC 4) Outcomes for IDPs and Host Communities

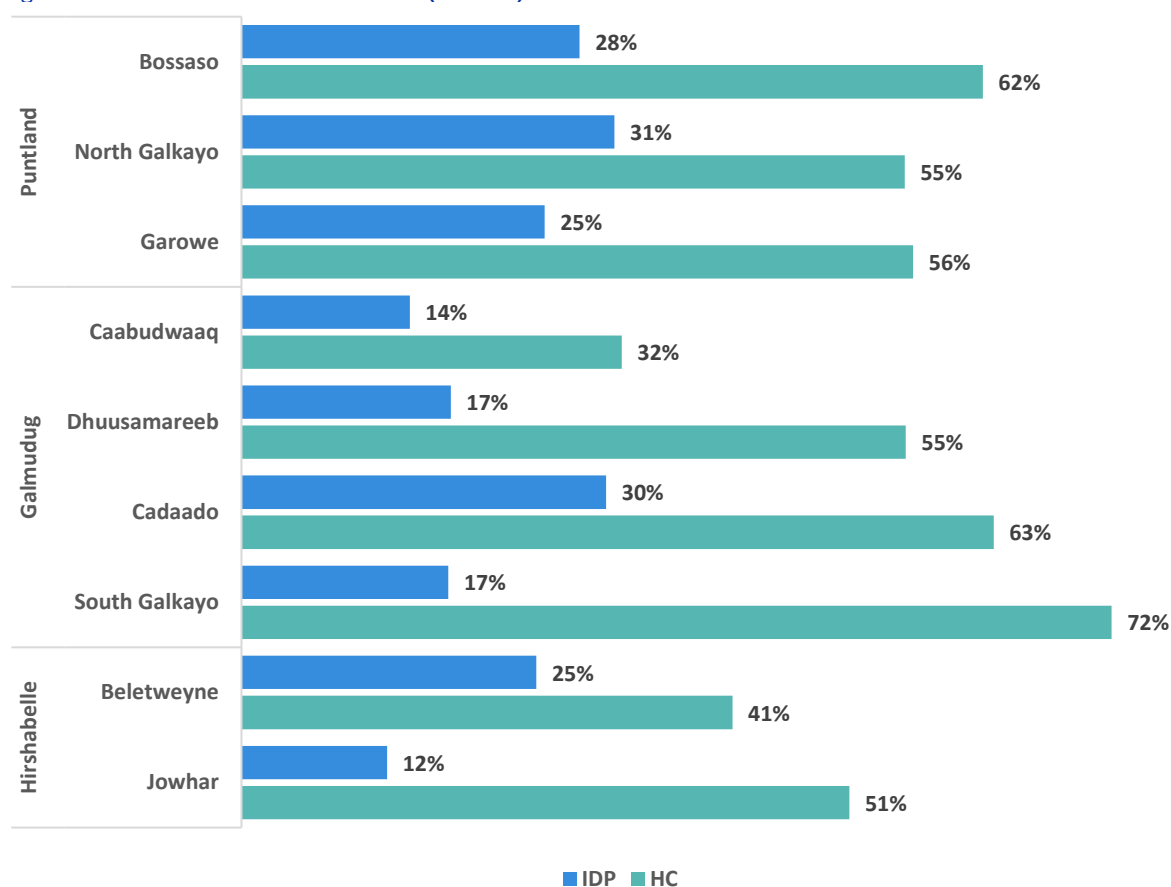

IASC 5: ACCESS TO DOCUMENTATION

Regarding Legal Identity Documentation, outcomes reveal one of the most pronounced and consistent disparities between host communities and internally displaced persons. While 54% of host community households report possession of legal identity documentation, this falls sharply to 23% among IDPs, indicating widespread exclusion from formal civil registration systems.

IDP outcomes remain critically low across all cities, dropping to 12% in Jowhar, 14% in Caabudwaaq, and 17% in South Galkayo, even in locations where host communities report relatively strong coverage, such as South Galkayo (72% HC) and Cadaado (63% HC). These persistent gaps highlight legal identity as a binding structural constraint, limiting IDPs' access to services, livelihoods, housing security, and participation in public life, and significantly undermining progress toward durable solutions.

Figure 10: Access to Documentation (IASC 5) Outcomes for IDPs and Host Communities

23%

among IDPs report possession of legal identity documentation, indicating widespread exclusion from formal civil registration systems

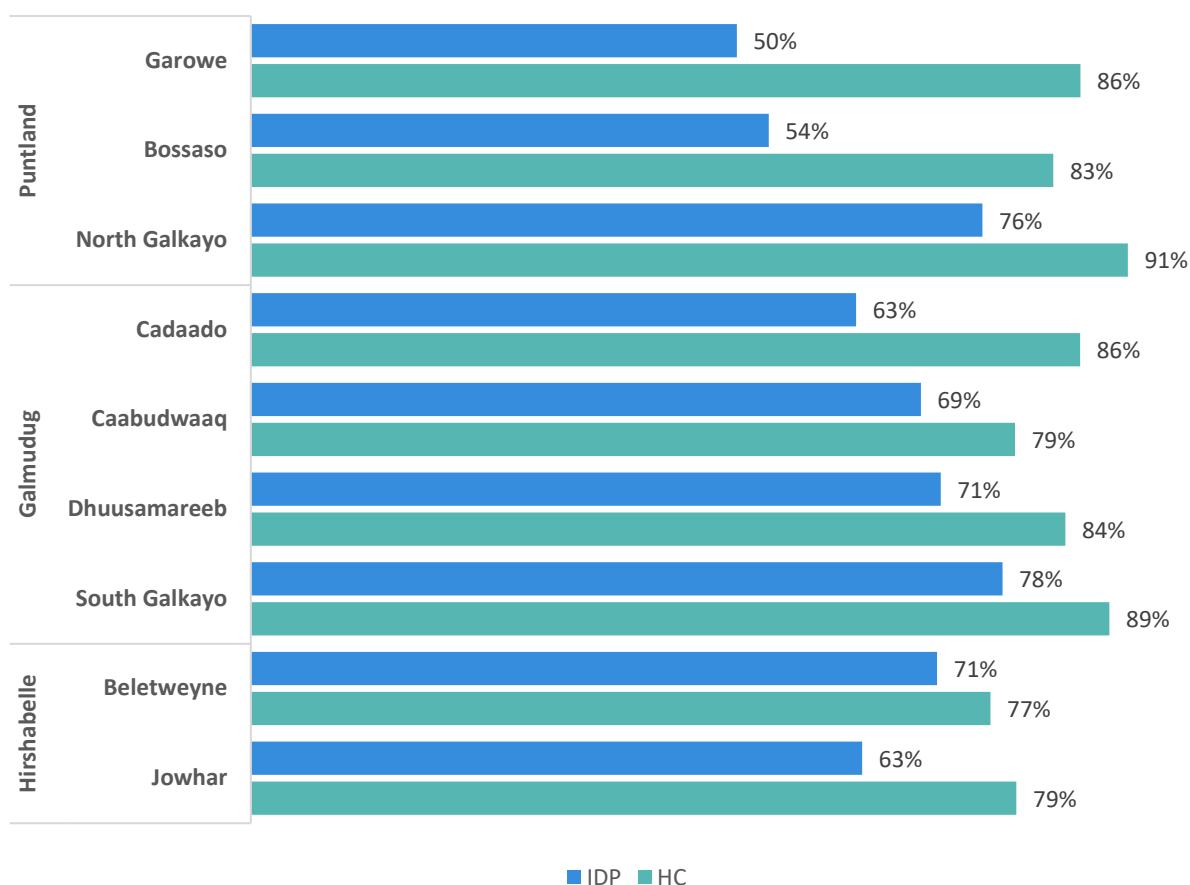

IASC 6: FAMILY REUNIFICATION

Family reunification outcomes are generally strong across all assessed cities for both host communities and internally displaced persons, although notable disparities persist in several locations.

Among host communities, positive outcomes range from 76% in Beledweyne to 90.8% in North Galkayo, indicating that a large majority of non-displaced households report being able to live with or reunite with close family members. IDP outcomes are consistently lower, ranging from 50% in Garowe to 77.8% in South Galkayo, with particularly low levels observed in Garowe (50%) and Bossaso (53.6%).

In all cities, host communities report higher family reunification outcomes than IDPs, with gaps exceeding 30 percentage points in Garowe (85.8% vs. 50%) and Bossaso (83% vs. 53.6%). While IDP outcomes exceed 70% in several cities, including North Galkayo (75.7%), South Galkayo (77.8%), and Dhusamareeb (71%), the persistence of these gaps indicates that displacement continues to disrupt family unity in many urban contexts.

Figure 11: Family Reunification (IASC 6) Outcomes for IDPs and Host Communities

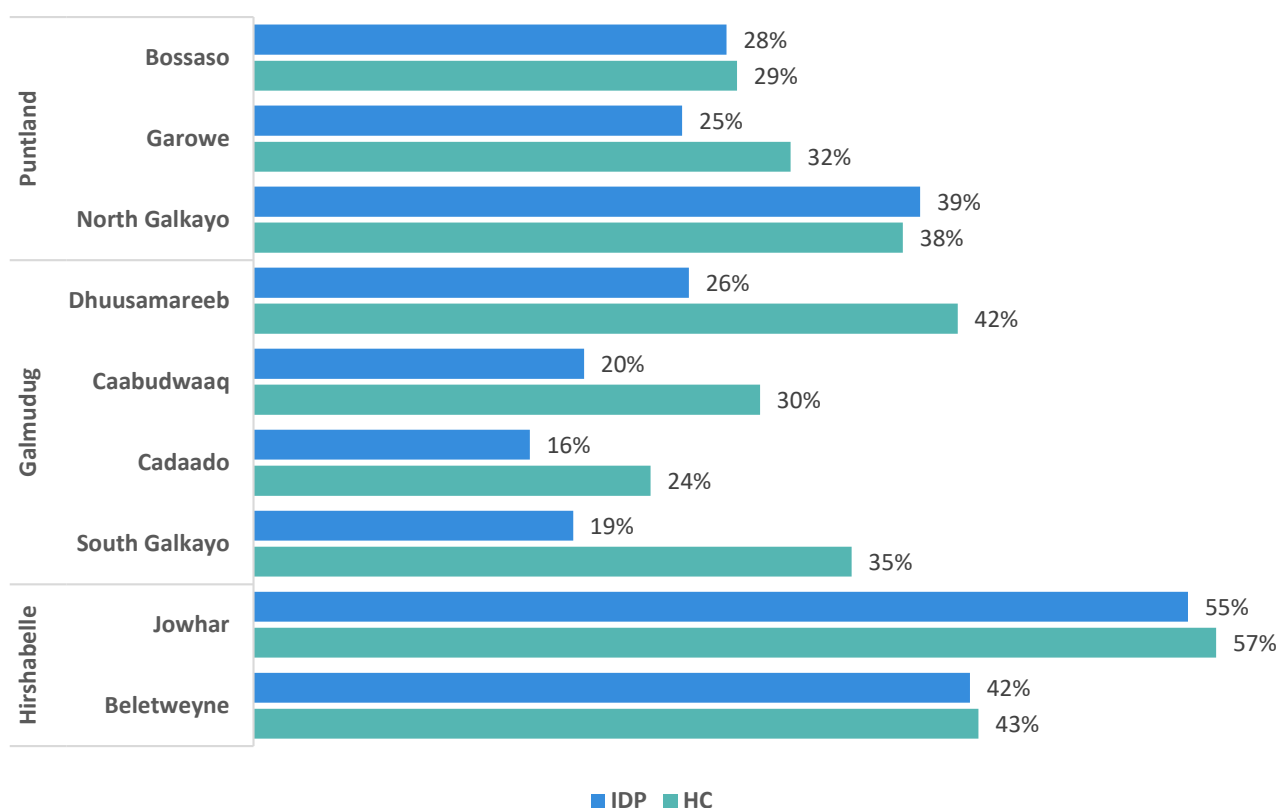

IASC 7: PARTICIPATION IN PUBLIC AFFAIRS

Participation in public affairs remains limited for both host communities and IDPs across all assessed cities, making it one of the weakest-performing domains. Among host communities, positive outcomes range from 23% in Cadaado to 57% in Jowhar, while IDP outcomes range from 16% in Cadaado to 55% in Jowhar. In most cities, fewer than half of households from either population group report participation in public decision-making or community governance structures.

Host communities generally report higher levels of participation than IDPs, although the differences are modest in several locations. In Bossaso, participation levels are nearly identical (28.6% for host communities and 28% for IDPs), while in Beledweyne, both groups report participation above 40% (42.9% and 42%, respectively). In contrast, wider gaps are observed in South Galkayo (35% vs. 18.9%) and Dhuusamareeb (41.7% vs. 25.8%), indicating reduced civic engagement among displaced households.

Figure 12: Participation in Public Affairs (IASC 7) Outcomes for IDPs and Host Communities

Across the assessed cities, fewer than half of households from either population group report participation in public decision-making or community governance structures

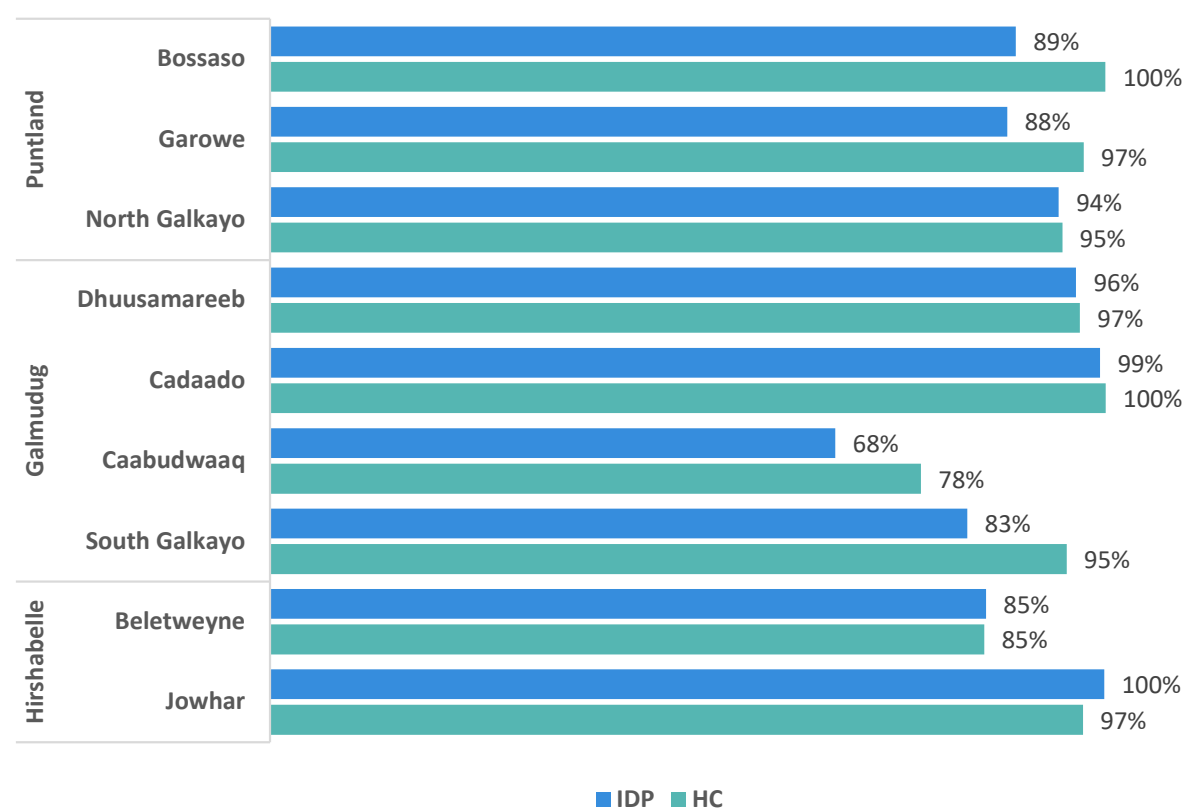

IASC 8: ACCESS TO EFFECTIVE REMEDIES AND JUSTICE

Access to effective remedies and justice is consistently high across all cities for both host communities and IDPs. Host community outcomes range from 77.7% in Caabudwaaq to 99.8% in Bossaso and Cadaado, while IDP outcomes range from 67% in Caabudwaaq to 99.6% in Jowhar. In most cities, more than 90 % of households report being able to access mechanisms for resolving disputes or seeking justice.

Differences between host communities and IDPs are relatively small compared to other domains, although host communities generally report higher outcomes. In Beledweyne, outcomes are nearly identical (85% for host communities and 85% for IDPs), while in Jowhar, IDPs slightly outperform host communities (99.6% vs. 97%). Larger gaps are observed in Bossaso (99.8% vs. 89%) and South Galkayo (95% vs. 83%), suggesting uneven access to justice mechanisms for displaced populations in some cities.

Figure13: Access to Effective Remedies and Justice (IASC 8) Outcomes for IDPs and Host Communities

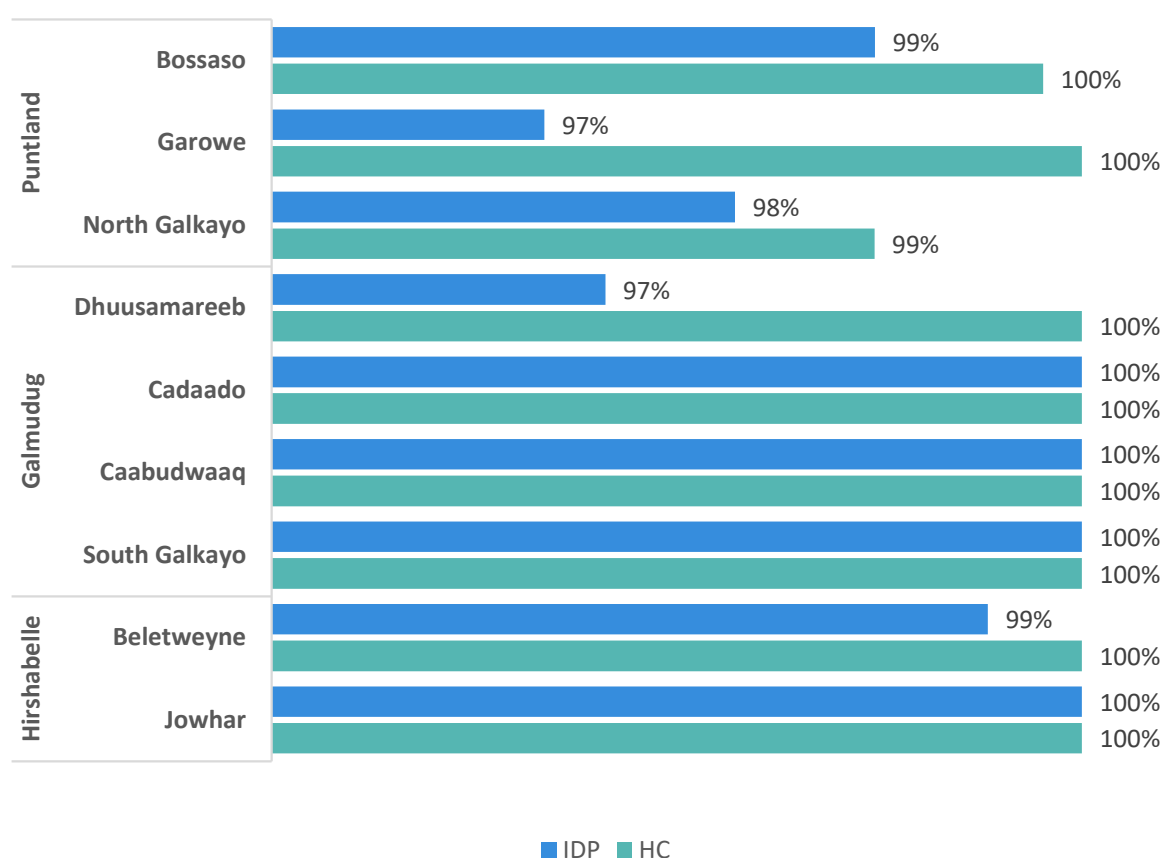

SOCIAL COHESION AND INTEGRATION

Social cohesion and integration outcomes are exceptionally high across all assessed cities for both host communities and IDPs. Host community outcomes range from 98.7% in North Galkayo to 100% in seven cities, indicating near-universal perceptions of coexistence and integration. IDP outcomes similarly range from 96.7 % in Garowe to 100% in five cities, including Caabudwaaq, Cadaado, Jowhar, and South Galkayo.

Differences between host communities and IDPs are minimal across all locations, with gaps generally below percentage points. Even in cities with slightly lower IDP outcomes, such as Dhusamareeb (97%) and Garowe (96.7%), reported levels of social cohesion remain very high. These findings indicate that, despite disparities in other durable solutions domains, social relations and coexistence between displaced and non-displaced populations are largely positive across urban settings.

Figure 14: Social cohesion and integration (IASC 9) Outcomes for IDPs and Host Communities

Reported levels of social cohesion remain very high. These findings indicate that, despite disparities in other durable solutions domains, social relations and coexistence between displaced and non-displaced populations are largely positive across urban settings

OVERVIEW: KEY SUMMARY INDICATORS – PHASE TWO CITIES

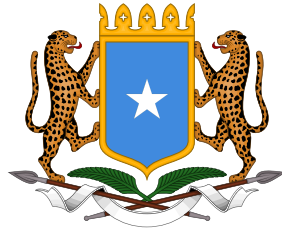

As described above, the DSP Index is based on measuring solutions progress amongst IDPs and host communities, based on the “core” IASC Durable Solutions criteria, and in close alignment with the National Solutions Pathways Action Plan and the National Durable Solutions Strategy. Under each of the criteria sit a total of 19 sub-criteria from the International Recommendations on IDP Statistics (IRIS).

Using data from the second phase of the DSP Survey, the table below presents aggregated findings for each criteria and sub-criteria. Analysis is presented for each of the eight DSP Survey phase two cities, disaggregated by IDPs and host communities. This aims to provide a full overview of key findings, allowing for an understanding of the key drivers and barriers to solutions progress in nine cities across the states of Hirshabelle, Galmudug and Puntland.

State City	Hirshabelle State				Galmudug State						Puntland State							
	Jowhar		Beletweyne		Dhuusamareeb		Caabudwaaq		Cadaado		South Galkayo		North Galkayo		Garowe		Bossaso
